Point-of-Sale System

# Point-of-Sale System

## Simple to Use

PROPworks® Cashier is a simple to use Point of Sale (POS) system that captures transaction data and makes it available to the airport's enterprise management system, providing the basis for effective and secure cash controls, efficient reconciliation, reporting, and operational analysis.

## Fully Integrated

Cashier is designed with airports in mind. It is fully integrated with the PROPworks® Revenue and Property Management system and is configurable to meet specific business and operational needs. Integration with PROPworks® allows for direct payment of invoices and security deposits, management of customer information, direct generation of sales from actual flight data.

Cashier runs on industry standard PC-type Point of Sale (POS) hardware, including touch screens, built in credit card swipe devices, and receipt printers. Fixed station and mobile units run the same software and share the same data in an operating group, called a Warehouse.

Additional warehouses can be set up to perform in a completely different business area of the airport, without interfering with other Warehouses, for example to process badge, ID and employee parking payments alongside general aviation transactions. Role based security ensures that employees access only the areas of the system that are pertinent to their job functions.

## Finance

Finance runs one or more copies of the software on office workstations, without the touch-screen capability, to monitor cash security and perform revenue accounting functions. Shift closing will populate general ledger information according to products sold, cash and credit card receipts, and taxes. Cashier is designed to accept standard bank credit cards as well as common aviation fuel credit cards such as Chevron, Multi Service, and AVCARD.
